

Module 3: Designing APIs

Spec driven development

- We discussed in the last modules about the benefits of designing an API first before actually building it
- This is often referred to as spec driven development
 - A development process where your application is built in two distinct phases
 - The creation of a spec (the design phase)
 - Development of code to match the spec (the development phase)
- In this module, we'll
 - Create this API specification using a standardized API description language (RAML)
 - Then learn to test it with users without writing any code

At the end of this module, you should be able to

- Define APIs with RAML, the Restful API Modeling Language
- Mock APIs to test their design before they are built
- Make APIs discoverable by adding them to the private Anypoint Exchange
- Create public API portals for external developers

Reviewing the options for defining APIs

Approaches to API design

Hand coding

API Blueprint

OpenAPI Spec

RAML

Introducing RAML

RAML: RESTful API Modeling Language

- **A simple, structured, and succinct way of describing RESTful APIs**
- A non-proprietary, vendor-neutral open spec
- Developed to help out the current API ecosystem
 - Encourages reuse, enables discovery and pattern-sharing, and aims for merit-based emergence of best practices
- RAML files can be used to auto-generate documentation, mocked endpoints, interfaces for API implementations, and more!

RAML
<http://raml.org>

RAML syntax

- RAML is based on broadly-used standards such as YAML and JSON
- Uses a human-readable data serialization format where **data structure hierarchy is specified by indentation**
 - Not additional markup characters

```

1  #%RAML 1.0
2  version: v1
3  title: American Flights API
4
5  /flights:
6    get:
7    post:
8
9    /{ID}:
10     get:
11     delete:
12     put:
13
14     responses:
15       200:
16         body:
17           application/json:

```

Notice the indentation used to specify to what each line applies

9

Defining resources and methods

- Resources are the objects identified by the web service URL that you want to act upon using the HTTP method used for the request
- All resources begin with a slash
- Any methods and parameters nested under a resource belong to and act upon that resource
- Nested resources are used for a subset of a resource to narrow it
 - URI parameter are enclosed in {}

```

1  #%RAML 1.0
2  version: v1
3  title: American Flights API
4
5  /flights:
6    get:
7    post:
8
9    /{ID}:
10     get:
11     delete:
12     put:
13
14     responses:
15       200:
16         body:
17           application/json:

```

Using API designer to define APIs with RAML

The screenshot displays the MuleSoft API Designer interface for the "American Flights API". The interface is divided into several sections:

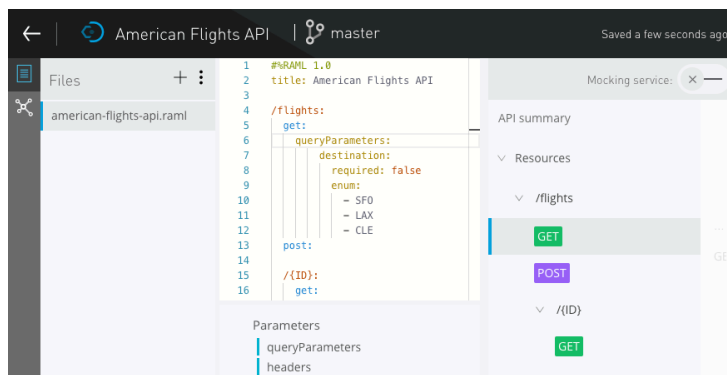

- File browser:** Located on the left, it shows a tree view of files including "examples", "exchange_modules", and "training". A label "File browser" points to this section.
- Editor:** The central area displays the RAML code for the API. A label "Editor" points to this section. The code includes:

```
1 #%RAML 1.0
2 version: v1
3 title: American Flights API
4
5 types:
6   AmericanFlight: !include
7     exchange_modules/68ef9520-24e9-4cf2-b2f5-620025690913/training-american-flight-data-type/1.0.1/AmericanFlightDataType.raml
8
9 /flights:
10   get:
11     queryParameters:
12       destination:
13         required: false
14         enum:
15           - SFO
16           - LAX
17           - CLE
18     responses:
19       200:
20         body:
21           application/json:
22             type: AmericanFlight[]
```
- API console:** Located on the right, it shows the API summary and resources. A label "API console" points to this section. It includes a "Mocking service" button and a list of resources with their methods (GET, POST, DELETE, PUT).
- Shelf:** A bottom section with tabs for "Types and Traits", "Others", and "Docs". A label "Shelf" points to this section. The "Types and Traits" tab is active, showing a table with columns "type" and "uriParameters".

Walkthrough 3-1: Use API designer to define an API with RAML

- Define resources and nested resources
- Define get and post methods
- Specify query parameters
- Interact with an API using the API console

13

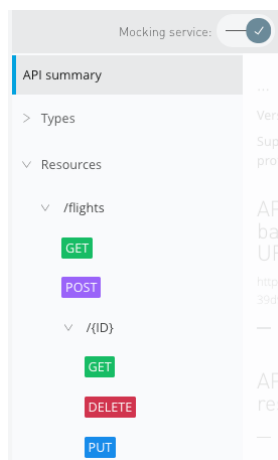

Testing API design without writing code

Simulating an API

- You can mock an API to test it before it is implemented
 - Useful to get early feedback from developers
- Use the **API console** and the **mocking service** to run a live simulation
 - Returns sample API responses defined in the API definition
- The API console is available in
 - API designer** – so the API designer can test it
 - API portals in Exchange** – so users/developers can test it

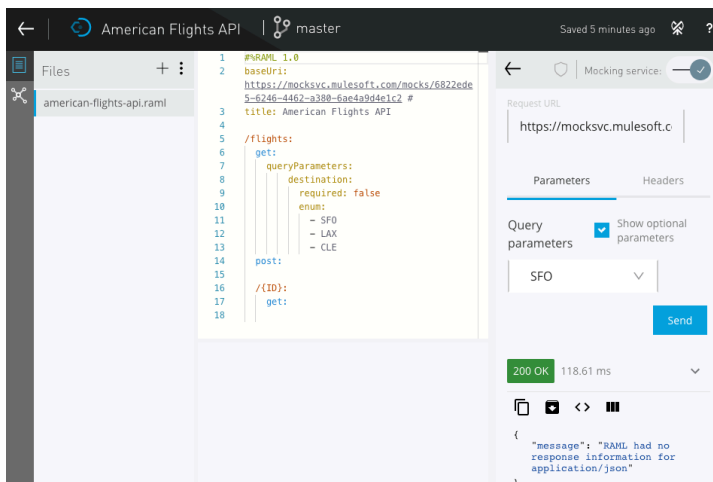

All contents © MuleSoft Inc.

15

Walkthrough 3-2: Use the mocking service to test an API

- Turn on the mocking service
- Use the API console to make calls to a mocked API

16

Using RAML to define specifications for requests and responses

Defining method response details with RAML

- Responses must be a map of one or more HTTP status codes
- For each response, specify possible return data types along with descriptions and examples

```

6  /flights:
7    get:
8      responses:
9        200:
10         body:
11           application/json:
12             example:
13               ID: 1
14               code: GQ574
15               price: 399
16               departureDate: 2016/12/20
17               origin: ORD
18               destination: SFO
19               emptySeats: 200
20               plane:
21                 type: Boeing 747
22                 totalSeats: 400

```

Defining method request details with RAML

- For a request, similarly specify the possible request data types along with data types, descriptions, and examples

```

6  /flights:
7  ⊕  get: ...
23  post:
24      displayName: Add a flight
25      body:
26          application/json:
27              example:
28                  code: GQ574
29                  price: 399
30                  departureDate: 2016/12/20
31                  origin: ORD
32                  destination: SFO
33                  emptySeats: 200
34                  plane:
35                      type: Boeing 747
36                      totalSeats: 400

```

19

Modularizing APIs

- Instead of including all code in one RAML file, you can modularize it and compose it of reusable fragments
 - **Data types, examples**, traits, resource types, overlays, extensions, security schemes, documentation, annotations, and libraries
- Fragments can be stored
 - In different files and folders within a project
 - In a separate API fragment project in Design Center
 - In a separate RAML fragment in Exchange

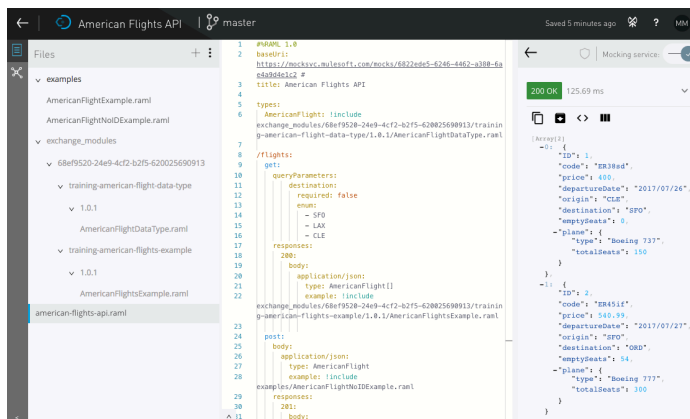

All contents © MuleSoft Inc.

20

Walkthrough 3-3: Add request and response details

- Use API fragments from Exchange in an API
- Add a data type to be used by resources in an API
- Specify data types for GET and POST method requests and responses
- Add example JSON requests and responses
- Create new files and folders in a project and import a file
- Test an API and get example responses

All contents © MuleSoft Inc.

Engaging with users

Engaging users during the API design phase

- To build a successful API, you should define it iteratively
 - Get feedback from developers on usability and functionality along the way
- To do this, you need to provide ways for developers to discover and play with the API
- Anypoint Platform makes this easy with **API portals in Exchange**
 - In **private Exchange** for internal developers
 - In a **public portal** for external developers

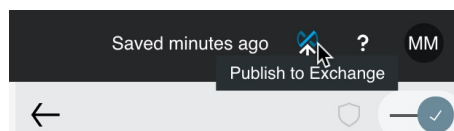

All contents © MuleSoft Inc.

23

Publishing RAML APIs to Anypoint Exchange

- You publish RAML API Specifications and RAML fragments to the Exchange **from API designer**
 - Not from Exchange itself
- **API portals** are automatically created for REST APIs added to Exchange
 - An **API console** for consuming and testing APIs
 - An **automatically generated API endpoint** that uses a **mocking service** to allow the API to be tested without having to implement it
- API portals can be shared with both internal and external users

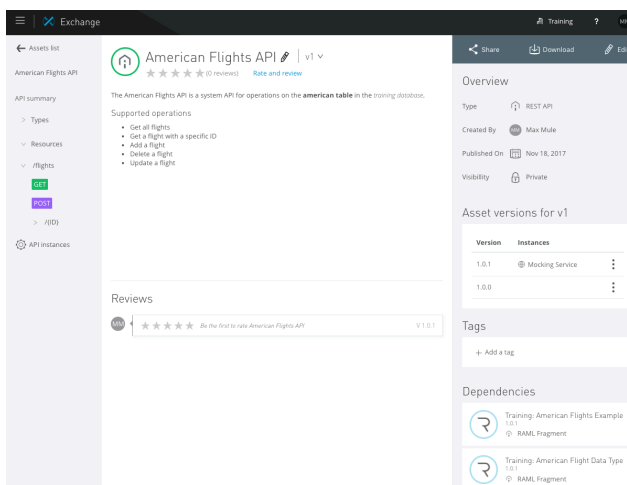

All contents © MuleSoft Inc.

24

Walkthrough 3-4: Add an API to the Anypoint Exchange

- Publish an API to Exchange from API designer
- Review an auto-generated API portal in Exchange and test the API
- Add information about an API to its API portal
- Create and publish a new API version to Exchange

All contents © MuleSoft Inc.

Sharing APIs

Sharing APIs

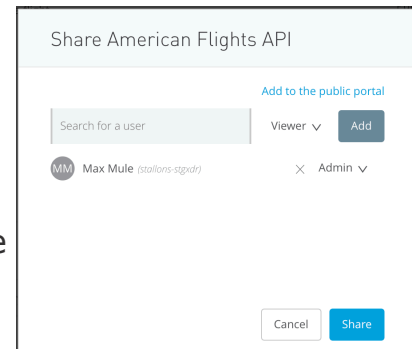

- You can share an API in Exchange with other internal or external users

- Share an API within an org through the **private Exchange**
- Share an API with external users in a **public portal** that you create from Exchange

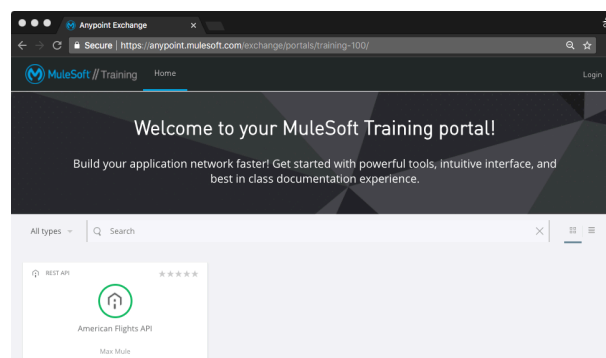

All contents © MuleSoft Inc.

Walkthrough 3-5: Share an API

- Share an API within an organization using the private Exchange
- Create a public API portal
- Customize a public portal
- Explore a public portal as an external developer

All contents © MuleSoft Inc.

28

Summary

Summary

- **RAML** is a non-proprietary, standards-based API description language spec that is simple, succinct, and intuitive to use
 - Data structure hierarchy is specified by indentation, not markup characters
- Use **API designer** to write API specifications with RAML
- Documentation is auto-generated from a RAML file and displayed in an **API console**
- A **mocking service** can be used in API console to test an API and return the example data specified in RAML

Summary

- Make an **API discoverable** by adding it to your **private Exchange**
- **API portals** are automatically created for the APIs with
 - Auto-generated **API documentation**
 - An **API console** that provides a way to consume and test an API
 - An **automatically generated API endpoint** that uses a **mocking service** to allow the API to be tested without having to implement it
- API portals can be shared with both internal and external users
 - Selectively share APIs in your org's **private Exchange** with other internal developers
 - Share APIs with external developers by creating and customizing a **public portal** from Exchange and specifying what APIs you would like to include in it
